Build chat - Pulso EPR

Builder: David Buzali with Codex Date: October 24, 2026 Course: Business Bending, Week 11 Purpose: Development transcript preserving the product decisions, implementation requests, tool results, defects, and fixes.

1. Inputs received

David supplied:

- the Week 11 assignment defining the Dragon Stack, packet-before-code, mechanical and persona passes, two deployments, security floor, and submission format;
- the Team 8 Blueprint assigning David the MONEY role and the EPR Commercial Viability Comparator under condition 2;
- a Week 11 Money position arguing for a paid packaging-evidence diagnostic only if a repeated local gap survives comparison with existing platforms; and
- a personal manifesto emphasizing meaningful impact, measurable real-world decisions, integrity, feasibility, health, relationships, delegation, and not abandoning himself while building.

David also established the operating instruction that coursework should be saved in `~/crystal-ball/cuaderno`, committed, and pushed, and that expired GitHub or Vercel access should trigger a login request.

2. Assistant interpretation

The assistant separated the user request from document content and treated the documents as assignment evidence. It extracted and visually reviewed all three Blueprint pages. The key conclusion was:

> *David's slice must test recurring commercial value. It must not become a generic EPR platform or claim environmental outcomes.*

The assistant proposed three bounded layers:

1. phone-based time-and-motion capture for actual workflow signals;
2. a clearly labeled synthetic linear model for cycle-two effort; and
3. transparent route-matching logic for spreadsheet, consultant, platform partner, and local adapter.

3. Authentication interruption

The local GitHub session initially reported an invalid token. David asked for a login link. The assistant started the official GitHub device flow and provided the URL `https://github.com/login/device` plus a one-time code. David authorized it, and the CLI reported successful authentication as `davidbuzali`.

Vercel was checked separately and remained authenticated as `davidbuzalibuilds-4052`.

4. Packet before code

Before implementation, the assistant:

- researched official Recyda, Specright, Lorax, and Mexican legislative sources;
- generated a high-fidelity Spanish product mockup with OpenAI image generation;
- wrote the exact-user definition, success condition, Mermaid feature flow and swimlane, benchmark, three-year view, scope cut, architecture, Blueprint mapping, test plan, acceptance criteria, and kill criteria; and
- committed these artifacts as the repository's first commit.

The implementation prompt was then written and committed separately. It specified small testable features, acceptance criteria, safeguards, and the planned commit sequence.

5. Implementation exchange

The assistant built a static React + TypeScript + Vite application with:

- validated bounded numeric inputs and no free-text fields;
- a measured phone mode with timer, checkpoint counter, visibility interruptions, and optional motion samples;
- a deterministic simulated sensor feed;
- synthetic ML projection with low/base/high range, version, confidence label, and drivers;
- conjunctive route constraints and an explicit no-winner outcome;
- visible evidence-status chips;
- burden and shadow-clause panels;
- mandatory human review before aggregate JSON export; and
- responsive, accessible styling.

The first build failed because Vite inherited a parent PostCSS configuration requiring a dependency the new project did not use. The assistant added a project-local empty PostCSS configuration. TypeScript and Vite then built successfully.

6. Browser QA and first deployment

The assistant opened the local production preview and inspected the phone-width visual layout and accessibility tree. It loaded the invented 24-SKU sample, confirmed reactive projections and route eligibility, switched sensor modes, and verified that review enables export.

Vercel deployment 1 completed at the stable alias:

<https://week-11-pulso-epr.vercel.app>

7. Mechanical defect and fix

During the first browser pass, the assistant found a real logic defect:

> *Selecting measured mode with zero minutes and zero checkpoints upgraded model confidence from exploratory to limited when declared evidence completeness was at least 70%.*

That behavior rewarded selection rather than evidence. The assistant changed the confidence gate to require measured mode, at least 15 active minutes, at least one checkpoint, and at least 70% declared completeness. Regression tests covered both empty and meaningful measurement cases.

The assistant also discovered that Google Fonts created a runtime third-party request despite the local-only privacy promise. It replaced the font import with system font stacks.

Six automated tests passed, covering validation, deterministic simulation, confidence gating, route constraints, human-review export gating, and identity-field absence.

Deployment 2 placed the fix at the stable alias. The live accessibility tree confirmed that measured mode with zero evidence still displayed `CONFIANZA EXPLORATORIA`.

8. Persona walkthrough and fix

The assistant used the invented Paula persona with a reset phone-width browser view. Paula's task was to identify which route merited investigation without treating the result as a compliance or purchase decision.

Two material confusions emerged:

1. the projection section's white heading could lose contrast because the navy pseudo-background rendered behind the wrong stacking layer; and
2. a green eligible route could feel like a recommendation even though the text said “Pasa para investigar.”

The assistant isolated the projection section's stacking context and changed the eligible verdict to:

> *Pasa el filtro | no es recomendación*

The phone-width projection heading was visually retested on navy, and the updated verdict appeared in the accessibility tree. Deployment 3 updated the production alias.

9. Final state

- Production build: passed.
- Automated tests: 6/6 passed.
- Security pattern scan: no likely secrets found.
- Runtime third-party font request: removed.
- Vercel deployments: three.
- Git commits before packaging: six.
- Mechanical bug: fixed and redeployed.
- Persona confusion: fixed and redeployed.
- Stable live URL: <https://week-11-pulso-epr.vercel.app>.

10. Remaining human action

The demo video must be recorded by David using the prepared 3-minute + 30-second script. A real buyer interview and a comparable second cycle remain future evidence; neither is represented as complete.
